

# MP 30

MP 30 are microparticles with a mean diameter of  $29.41 \mu\text{m}$ . The distribution of this dust is monodisperse; the geometric standard deviation of the distribution is only  $3.4 \mu\text{m}$ . Due to this small distribution, these dusts are used for scientific analysis and can also be used to calibrate measuring devices.

## OPERATION PRINCIPLE

### MICROPARTICLES WITH A MEAN DIAMETER OF $30 \mu\text{m}$

The particles consist of PMMA (Polymethylmethacrylat).

## BENEFITS

- Solid particles with very narrow monodisperse distribution
- High lifetime of the generated aerosol

## DATASHEET

Particle material	PMMA
Particle diameter (maximum)	75 $\mu\text{m}$
Particle diameter (minimum)	0.5 $\mu\text{m}$
Particle diameter (mean)	29.41 $\mu\text{m}$
Geometric standard deviation (volume)	3.4 $\mu\text{m}$
