

# RESP-AER-METER INFECTION GUARD

Superspreaders or superemitters are people who have a particularly high number of pathogens in the air they breathe. They are therefore considered to be particularly infectious.

The Resp-Aer-Meter Infection Guard helps to identify respective persons and corresponding infection risks among athletes. This allows to initiate appropriate safety measures.

## 优势

- So-called "superemitters" can be identified in 30s thanks to a high number of particles
- Fast differentiation between infectious and less infectious Covid-19 carriers
- Measurement of the aerosol concentration and aerosol size in exhaled air
- Detection of particles from 145 nm to 10  $\mu\text{m}$
- Highest resolution, especially in the virus size range from approx. 145 nm to 1  $\mu\text{m}$
- Immediate evaluation and documentation of the measurement result

## 应用领域

- Detection of potential superspreaders, for example in professional team training or rehearsals

## 技术数据

测量原理	Optical light-scattering	测量范围(数量浓度)	0 – 20,000 particles/cm <sup>3</sup>
测量范围(粒径)	0.15 – 10 $\mu$ m	体积流量	9.5 l/min
User interface	Touchscreen, 800 • 480 pixel, 7" (17.78 cm)	Data acquisition	Digital, 20 MHz processor, 256 raw data channels
Power consumption	Approx. 200 W
