

RESP-AER-METER SCIENTIFIC

Besides the detection of a potential superspreader, the Resp-Aer-Meter Scientific offers access to a wide range of other measurement data, such as number of particles, size and size distribution, time course, measurement times, and much more. In addition, many parameters, such as the measurement duration or limit values can be set individually.

优势

- So-called "superemitters" can be identified in 30s thanks to a high number of particles
- Fast differentiation between infectious and less infectious Covid-19 carriers
- Measurement of the aerosol concentration and aerosol size in exhaled air
- Detection of particles from 145 nm to 10 μm
- Highest resolution, especially in the virus size range from approx. 145 nm to 1 μm
- Immediate evaluation and documentation of the measurement result

应用领域

- Medical-scientific research, to answer questions such as
 - Do infectious respiratory diseases differ by exhaled particle size distribution?
 - Is an increased particle concentration in the breath due to a specific particle size range?
 - How do disease variations or personal characteristics (age, BMI, previous diseases...) influence the outcome?

技术数据

测量原理	Optical light-scattering	测量范围(数量浓度)	0 – 20,000 particles/cm ³
测量范围(粒径)	0.15 – 10 μm	体积流量	9.5 l/min
User interface	Touchscreen, 800 • 480 pixel, 7" (17.78 cm)	Data acquisition	Digital, 20 MHz processor, 256 raw data channels
Power consumption	Approx. 200 W
